# Radiochemistry Webinars

## Environmental/Bioassay Radiochemistry Series

### *Bioassay*

*In Cooperation with our  
University Partners*

# Meet the Presenter...

*Robert Jones*

Dr. Jones is the Chief of the Inorganic and Radiation Analytical Toxicology Branch at the Centers for Disease Control and Prevention (CDC). His responsibilities include planning, implementation, oversight, and completion of programs related to public health that involves non-radioactive and radioactive elements or their isotopes. These programs involve research and development of a wide variety of analytical methods to enable the CDC to assay and monitor the exposure of populations to toxic or radioactive element exposures. The programs also involve a large amount of analytical services to various programs in which the laboratory collaborates with other national and international government agencies, state health departments and universities. These programs look at a broad spectrum of essential, trace and toxic metals using, Inductively Coupled Plasma Mass Spectrometry with Dynamic Reaction Cell Technology, HPLC or GC coupled to Inductively Coupled Plasma Mass Spectrometry with Dynamic Reaction Cell Technology, Electrochemical, Gamma Spectroscopy, Alpha Spectroscopy and Liquid Scintillation methods. Dr. Jones is also overseeing the development of a variety of radionuclide bioassay methods for emergency and terrorism preparedness and response. These methods will allow CDC to assist the states in responding to a major radiological or nuclear incident and allow for the assessment of contamination and exposure in people and to enable the efficient use of medical countermeasures. Dr. Jones' responsibilities also include the implementation and laboratory aspects of multiple local, state, regional, national and international health studies or investigations, responses to multiple Epidemiological Aids and "emergency responses." The Branch is also involved with many long-term (multi-year) local, national or international public health studies. Dr. Jones has 106 publications in the field of analytical chemistry, biophysical chemistry, clinical chemistry and Biomonitoring. He has presented more than 60 national or international invited talks or workshops related to the laboratory aspects of inorganic Biomonitoring as well as chemical and radiological terrorism preparedness and response. Dr. Jones is a Co-Chair of multiple workgroups in the DHS Integrated Consortium of Laboratory Networks (ICLN) and is a member of several CDC, DHS, HHS, FEMA and CLSI national workgroups or committees.

# Bioassay for Emergency Response

**Robert L. Jones, PhD**  
**Chief, Inorganic and Radiation**  
**Analytical Toxicology Branch**

# Disclosure

Mention of company or product names does not constitute endorsement by the National Center for Environmental Health (NCEH), Centers for Disease Control (CDC), or the Public Health Service.

# Potential Radiological or Nuclear Incidents

- Nuclear
  - Damaged nuclear facility
  - Improvised nuclear device
  - Nuclear weapon
- Radiological
  - Radiological dispersion device (RDD);  
e.g., “Dirty bomb”

# Population Monitoring

**Following an environmental release of radioactive material, large numbers of people may require external and/or internal monitoring and, if indicated, decontamination.**

# The Boston Marathon

**April 15th, 2013**

**Explosive device detonated**

# The Boston Marathon

April 15th, 2013

- ~26,000 Runners from 55 States and Territories
- ~500,000 Spectators

# The Boston Marathon

# What if?

# The Boston Marathon

**What if  
It had been an RDD  
("Dirty Bomb")?**

# Bioassay Objective

After a Radiological Incident, Public Health Officials Will Need to Answer the following:

- **What** are people exposed to or contaminated with?
- **Who** was exposed or contaminated?
- **How much** exposure or contamination did each person have?

The decision to medically treat people will depend on our ability to **rapidly** and accurately **identify** and **quantify** internal contamination

# Dispersal Pattern

-  Fireball Interaction Area ( $< 100 \mu\text{m}$ , about 5% of material in fireball)
-  Large Particles ( $\approx 100 - 500 \mu\text{m}$ )
-  Ballistic Fragments ( $> 1 \text{ cm}$ )
-  Downwind Fallout (small particles)

# Was it a Widespread Dispersal?

(M. Brown, LANL)

# CDC Guidance on Population Monitoring and Safety

- Target audience:
  - State and local public health and emergency preparedness personnel
- Focus:
  - Terrorism incidents involving mass casualties
- Scope:
  - Assumes local infrastructure is intact
  - Principles apply to all radiation incidents
- Currently being revised

# Examples of Contamination Triage Testing

**DRAFT Calculations -**

**Adult, 1 day Post exposure**

# Bioassay Testing

- **Capability:** Rapid **screening, identification** and **quantitative** assessment of **internal** incorporation of radionuclides to quantify exposure or dose (“health risk”)
- **Capacity:** ID and Quantify approximately 300 samples per day
- **Dose Range:**
  - 0.0001 to >2 Sieverts (Sv) - analytical sensitivity
  - Medical Treatment Threshold –
    - 0.05 Sv Children and Pregnant Women,
    - 0.25 Sv for the general population (**CDG**)
- Provide initial identification of a possible poisoning (e.g.  $^{210}\text{Po}$ )
- Assist with the Epidemiological (EPI) investigation

**CDG = Clinical Decision Guide**

# Rapid Radionuclide Bioassay Analytical Methods: Traditional Versus New Methods

“Traditional” Radionuclide  
methods: DOE

New “Rapid”  
methods: CDC

Time to first analytical results for 40-200 samples	About 3-6 <i>days</i>	Less than <b>24 hours</b>
Sample Requirements	<b>24 hour</b> collection	“ <i>spot</i> ” collection
Sample Size Requirement	1 -2 L	15-70 mL
Number of radionuclides with validated clinical methods	Limited to contract	22 + “fission products” (14 current)
Sample throughput	<b>10-20 samples per day</b>	<b>250 -3000 samples per day</b>
CLIA Certified Methods	no	yes
Scalable for “Surge Capacity”	minimal	yes

# Bioassay: Key Issue

## Detection of Internal Contamination

Radionuclides	Urine bioassay detection	Primary radiation detection
Uranium ( $^{235}\text{U}$ , $^{238}\text{U}$ ), Thorium	yes	<b>alpha and beta</b>
Strontium, Plutonium ( $^{238}\text{Pu}$ , $^{239}\text{Pu}$ )	yes	
Americium, Californium, Neptunium,	yes	
Phosphorus, Curium, Polonium	yes	
Cesium, Cobalt ( $^{57}\text{Co}$ , $^{60}\text{Co}$ ), Radium	yes	<b>Gamma rays</b>
Iodine ( $^{125}\text{I}$ , $^{131}\text{I}$ ), Technetium-99m	yes	
Selenium, Molybdenum, Iridium	yes	

Internal radiation screening via hand held detectors or portals is only applicable for gamma emitting radionuclides.

Radionuclides of concern can be found at:

# Alpha & Beta Emitters

# Liquid Scintillation: Gross Alpha/Beta Screen, Sr-90 Quantitative (in development)

# Liquid Scintillation: Gross Alpha/Beta "Screen"

- **Cocktail: Ultima Gold AB**
- **Sample volume: 5 mL**
- **Cocktail volume: 15mL**
- **Sample analysis time: 7 min**
- **LOD: Gross Alpha – 5.3 Bq/L**
- **LOD: Gross Beta – 31 Bq/L**

# Liquid Scintillation: P-32 and H-3

- **Cocktail:**
- **Sample volume: 5 mL**
- **Cocktail volume: 15 mL**
- **Sample analysis time: 7 min**
- **LOD: P-32 – 23.6 Bq/L**
- **LOD: H-3 – 28.7 Bq/L**

# Alpha Emitters

# Alpha Spec: Po-210

- Sample volume: 10 mL
- Sample prep time: 1.8 hours
- Sample count time: 1 hour
- LOD: 0.65 Bq/L

**Not fully validated at this time**

# Gamma Emitters

# General Method Parameters (NaI)

- **Screening Method:** rapid analysis for the screening of gamma emitting radionuclides in clinical samples
- **Concept:** allow for “screening” in 5 to 10 minutes, to determine if above a “baseline level”
- **Automation (Autosampler):** currently being evaluated

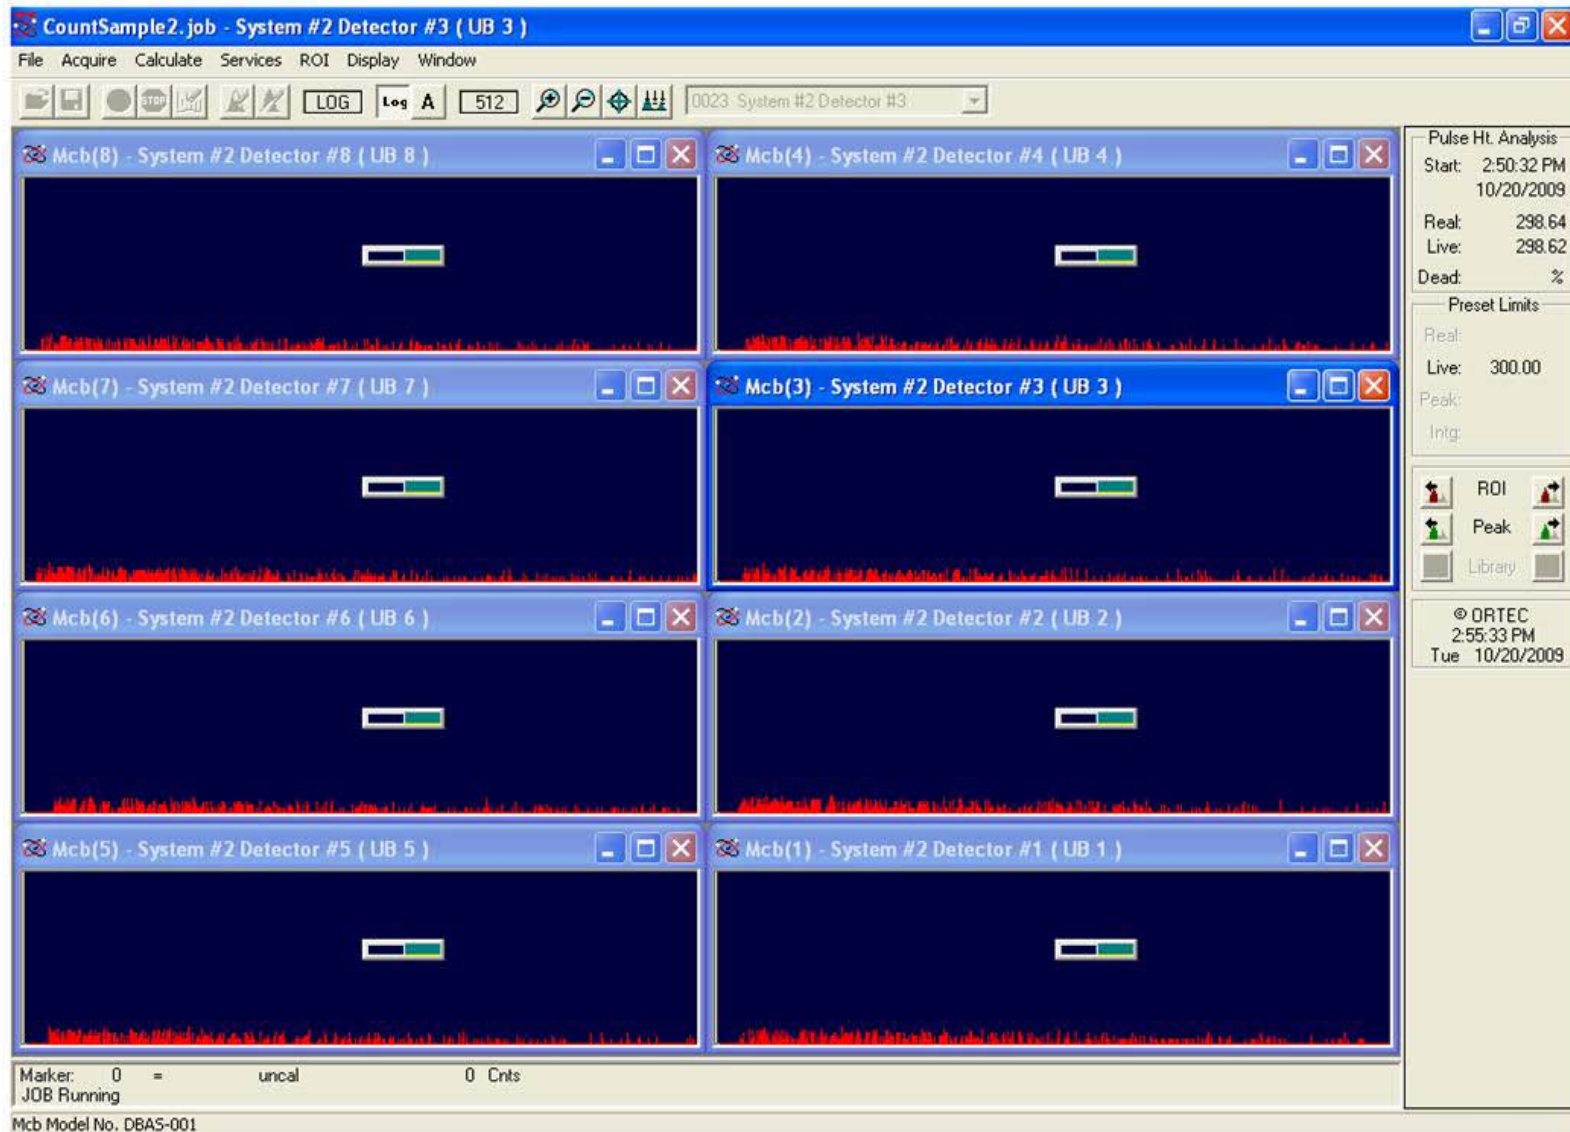

# Emergency Response Urine Containers

# New Custom NaI Well Detector

# Count Sample - 300 sec

# HPGe Detectors

# HPGe Method Parameters

- Energy Range: 40 – 2000 keV
- LODs:
  - $^{57}\text{Co}$  92 Bq/L
  - $^{137}\text{Cs}$  57 Bq/L
  - $^{60}\text{Co}$  76 Bq/L
  - $^{192}\text{Ir}$  26 Bq/L
- Sample Size\* = 50 mL
- Count Time = 900 seconds
- Samples per 900 seconds = 3 (3 Instruments)
- Samples per hour = 12 (3 Instruments)
- Samples per day = **240 / 20 hours (3 Instruments)**

\* Evaluating a 10mL sample size (tube geometry) in a large well detector

## Radiation Emergencies

CDC has a key role in protecting the public's health in an emergency involving the release of radiation that could harm people's health. This site provides information to help people protect themselves during and after such an event. It also provides information for professionals involved in planning for and responding to this type of emergency.

**Highlights**

- Japan Response 2011
- 2011 Radiation Emergency Preparedness Conference

### Your Health and Safety

**Protecting Yourself and Your Family**

Preparing for an emergency and what to do during an emergency

**Health Effects and Treatments**

Health effects such as acute radiation syndrome; potential treatments (potassium iodide, Prussian blue, DTPA, Neupogen)

**Radiation and Pregnancy**

Possible health effects of radiation on pregnant women

**Types of Radiation Emergencies**

Terrorist events (such as dirty bombs and nuclear blasts) and unintentional emergencies (such as reactor accidents)

### Radiation Emergency Toolkits

**Public Health Officials**

**Emergency Services Clinicians**

**FREE** Radiation emergency tool kits are available for ordering.

To order copies, please send an e-mail to [cdcinfo@cdc.gov](mailto:cdcinfo@cdc.gov)

or call 1-800-CDC-INFO (1-800-232-4636); TTY: (888) 232-6348.

# Urine Collection and Processing

## Centers for Disease Control and Prevention Specimen-Collection Protocol for a Radiological/Nuclear-Exposure Event

For detailed instructions, see the Centers for Disease Control and Prevention's "Shipping Instructions for Specimens Collected from People Who May Have Been Exposed to Radiological/Nuclear -Terrorism Agents."

For each person, collect 70 mL or more of urine in a screw-cap urine cup by following the steps below:

Wash hands with soap and water.

Collect 70 mL or more of urine in a screw- cap urine cup.

Deliver specimen to clinic personnel.

Label the urine cup with the appropriate bar-coded label, indicating the method of collection if other than "clean catch."

Place bar-coded label on all cups so that when upright, the barcode looks like a ladder.

Freeze samples (optimally at -70° C or use dry ice).

**For questions concerning this process, please contact:**

# Urine Shipping Instructions

## Instructions for Shipping Urine Specimens to the Centers for Disease Control and Prevention after a Radiological/Nuclear Exposure Event

This guidance is in accordance with the International Air Transport Authority Packing Instruction (IATA) 650 for Biological Substance, Category B.

For detailed instructions, see the Centers for Disease Control and Prevention (CDC)'s "Shipping Instructions for Specimens Collected from People Who May Have Been Exposed to Radiological/Nuclear Terrorism Agents."

To separate urine cups, use a grid and/or individually wrap the urine cups. Place absorbent material in the bottom of the box and insert the cups.

Use one continuous piece of evidence tape to seal the box containing the urine cup(s). Write initials half on the evidence tape and half on the box or bag.

Wrap the box with absorbent material and secure with tape. Seal the box inside a Saf-T-Pak inner leak-proof polybag (or equivalent).

Place the sealed Saf-T-Pak inner leak-proof polybag (or equivalent) inside a white Tyvek® outer envelope (or equivalent).  
Note: If primary receptacles do not meet the internal pressure requirement of 95 kPa, use compliant secondary packaging materials.

Seal the opening of this outer envelope with a continuous piece of evidence tape. Write initials half on the evidence tape and half on the envelope.

Use a polystyrene foam-insulated, corrugated fiberboard shipper to ship boxes to CDC. Place an absorbent pad in the bottom of the shipper.

Place a layer of dry ice in the bottom of the shipper on top of the absorbent material. DO NOT use large chunks or flakes of dry ice.

Place the packaged urine cups in the shipper. Use absorbent material or cushioning material to minimize shifting while box is in transit. Place additional dry ice on top of samples.

Place the urine shipping manifest in a sealable plastic bag and put the bag on top of the packaged samples inside the shipper. Keep chain-of-custody documents for your files. Place lid on the shipper.

Secure the outer container lid with filamentous shipping tape. Place your return address in the upper left-hand corner of the shipper top and put the CDC receiving address in the center (see Instruction 13. below for address).

For questions concerning this process, please contact:

Centers for Disease Control and Prevention  
Sample Logistics Laboratory (IRAT)  
4770 Buford Hwy., NE  
Building 110, Loading Dock  
Atlanta, GA 30341  
Phone: 770-488-7227  
Email: SampleLogistics@CDC.gov

Add the UN 3373 label and the words "Biological Substance, Category B" on the front of the shipper. UN 3373 is the code identifying the shipper's contents as "Biological Substance, Category B."

Place a Class 9/UN 1845 label on the front of the shipper. This label is to indicate the use of dry ice (in kg) in the shipper and the proper name (either dry ice or carbon dioxide, solid)

Send shipment to:  
Centers for Disease Control and Prevention  
Attention: Sample Logistics  
4770 Buford Hwy., NE

# Future Radionuclide “Biomonitoring”

- Radon-222
- Polonium-210
- Sr-90
- Tc-99m – Mo-99
- Medical isotopes

# Radiological Incident Impact

- Loss of life
- Acute radiation exposure
- Potential future cancer risk
- Psychosocial issues
- Economic impact, including area denial (due to contamination)
- Increased anxiety among citizens

# Summary

- Radiation Laboratory Methods (bioassay): **rapidly identify** and **quantify specific** radionuclides in people potentially contaminated in a radiological or nuclear event.
- Provides critical information for **effective** medical management of individuals by **assessing risk** for medical management and **follow-up**
- Provides information for population monitoring (populations and population sub-groups)
- Provides “**negative**” results for people who think that they may be contaminated, but, are not truly contaminated.
